AUTHOR YEVREINOVA, T.N., and LARIONOVA, T.I.  
TITLE Protein-Carbohydrate Coacervates and Catalase  
(Belkovo - uglevodnye koatservaty i katalaza. Russian)  
PERIODICAL Doklady Akademii Nauk SSSR, 1957, Vol 115, Nr 1, pp 133-136 (U.S.S.R.)  
ABSTRACT The present work is a continuation of the studies of the influence of ferments in coacervate systems. In the present studies coacervates were produced of gum arabic and gelatine, protamin and gum arabic as well as protamin and gelatine. Their use made it possible to study the activity of catalase at from 4,2 - 9 pH. Liver catalase and a bacterial catalase (of *Micrococcus lysodeikticus*) served as ferments. The influence of catalase was determined in the following systems: I. in coacervate. II. in coacervative drops. III. in balanced liquid. IV. in buffer solution. Bacterial catalase: The ferment proved to be practically inactive at 4,27 pH. When pH was raised to from 6,3 - 6,4 the ferment could be reactivated only partly. The ferment, without preliminary influence of an aciduous medium, has a high activity at from 6,0 - 6,3 pH. The indices of the determination in the coacervate with 6,0 pH are mentioned in tables 1 - 3 . 1.) The activity on the ferment is practically the same both in the coacervate as a whole and in the fractions corresponding to its drops. In balanced liquid its activity is of minor character. 2.) The ferment is active in a

Card 1/3

20-1-36/54

**Protein-Carbohydrate Coacervates and Catalase**

very high dilution. In the case of the use of higher ferment concentrations the whole  $H_2O_2$  decomposes in the solution as well as in the coacervate: a substratum is lacking. At the same time the increase of the super-oxide quantity is undesired because of the destruction of coacervate drops. 4.) The greatest activity of catalase is to be found in coacervates at  $43^{\circ}$  in the buffer solution, however, at  $37^{\circ}$ . Protamin reduces the activity of catalase. Liver catalase: Experimental results are mentioned in table 6. At 4,27 pH the whole ferment was practically concentrated in the coacervate drop. At 6,0 pH catalase can be found mainly in balanced liquid. The results of the present work lead to the assumption of a possible vacuole rôle in the cells. In vacuoles there are less colloides than in the surrounding plasma. It is, therefore, possible that the formation of vacuoles as well as a local liquefaction of plasma in cells as well as in one-cell animals promotes the acceleration of fermentative processes more in this respect than is the case in a viscous plasma. (7 tables and 6 Slavic references).

TITLE: Purine and Pyrimidine Bases of the Thermophile Variety of Bacillus mycoides (Purinovyye i pyrimidinovyye osnovaniya termofil'nogo varianta Bacillus mycoides)

PERIODICAL: Doklady AN SSSR, 1958, Vol. 118, Nr 2, pp. 334 - 337 (USSR)

ABSTRACT: It is to be assumed that thermophile microorganisms must have their chemical peculiarities. The chemistry of life at high temperatures is, however, very little investigated. Many purine- and pyrimidine-bases are contained in the nucleic acids, nucleotids and nucleosides of the microbes. The former contain 3 groups and serve as sources of co-enzymes of a number of biological reactions and energy-rich phosphorus compounds (reference 4). It is of interest to determine which influence is exerted by the high temperature upon the total content of purine- and pyrimidine-bases. The thermophile proteolytic variety of Bacillus mycoides chosen as test object was isolated from the dregs of sewage which are fermented in thermophile vessels of methane production (reference 1). Table 1 gives the morphological characteristic of 2 cultures: a) at 58°C and b) at 44°C. The purine- and pyrimidine-bases were determined by distilling off of alcohol from alcohol-centrifugates. The chromato-

Card 1/2

20-2-37/6a

Purine and Pyrimidine Bases of the Thermophile Variety of *Bacillus mycoides*

graphic method on paper was used for this (references 8, 9). The 4-contents of the bases in the bacterial mass were determined (table 2). From this is to be seen that with an increase in temperature from 44 to 58°C the total amount of these bases decreases by about 38 %. The content of every individual basis in the culture cultivated at 58°C is smaller than at 44°C. The temperature is a factor which accelerates chemical enzymatic reactions, consequently also the biological processes. The decrease in these bases may here possibly be explained by the fact that the increased temperature partially replaces the enzymatic activity and the energy which were connected with the presence of the bases in the microorganisms. The following bases were determined: guanine, adenine, cytosin, uracyl, and thymine. There are 3 figures, 2 tables, and 9 references, 4 of which are Slavic.

TITLE:

Weight Determination of Isolated Coacervate Drops by Means of Interference Microscopy (Opredeleniye vesa otdel'nykh koatservat-nykh kapel' s pomoshch'yu interferencionnoy mikroskopii)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 3, pp 688-690 (USSR)

ABSTRACT:

The phenomenon of coacervation is wide-spread in organisms and can also be reproduced in artificial objects (Refs 4,6). In the latter case, a concentration of the colloidal particles from dilute solutions takes place, the particles separating from the liquid in the form of drops or of a layer. Consequently, the nature of coacervation consists in the transition of a dissolved, diffusely spread substance into more solid formations that have new, specific properties (Ref 2). In this process, the concentration of the substances reaches considerable dimensions. As, e.g., the concentration of the nucleic acids in individual drops was fifteen times as high as that of the nucleic acids in the solution, it was possible to determine these acids in individual coacervate drops by means of an ultraviolet microscope. However, there are many compounds which, unlike nucleic acids, do not absorb the ultraviolet rays, but which readily form coacervate drops (proteins, carbohydrates, lipides).

Card 1/3

SOV/20-124-3-56/67

Weight Determination of Isolated Coacervate Drops by Means of Interference  
Microscopy

Scientific publications do not contain any data on the concentration degrees of these substances in individual coacervate drops. In the paper under consideration, the concentrations of protein and carbohydrate were determined by the aid of interference microscopy. For this purpose, (a) a bifocal interference microscope, and (b) a Shiring microscope were used. The coacervate drops (9 - 177 $\mu$  diameter) were obtained separately from aqueous gelatine and gum arabic solutions (Fig 3), as well as by the addition of ribonucleic acid (Figs 4,2) and desoxyribonucleic acid (Figs 4,3). From an analysis of the curves in figures 3 and 4 it can be seen that (1) the dry weight of the drop increases with increasing volume. The concentration of the dry substances, calculated per volume unit, decreases (Table 1). In coacervate drops which contain ribonucleic acid and sodium acetate in addition to gum arabic and gelatine, the dry weight increases by the 55-fold with a volume increase by the 141-fold, whereas the concentration recedes to the 1:2.5-fold. The same applies to drops containing desoxyribonucleic acid instead of ribonucleic acid. (2) The concentrations of gum arabic and of gelatine in individual coacervate drops is 12.47 times higher than in the initial solutions. The highest concentration of the 5 above

Card 2/3

SOV/20-124-3-56/67

Weight Determination of Isolated Coacervate Drops by Means of Interference Microscopy

mentioned substances was observed in the smallest drops, which also showed greater density than the large drops. The small drops are characterized by a linear dependence between the volume of the drop, its weight, and the concentration of dry substance therein.

(3) In one and the same coacervate, consisting of drops and a liquid in equilibrium, drops of most different weights and volumes occur. Their weights may equal those of certain unicellular organisms. Professor A. N. Zakhar'yevskiy assisted in the investigations, A. I. Oparin, Academician, conducted the work.- There are 4 figures, 1 table, and 8 references, 4 of which are Soviet.

AUTHOR: Yevreynov, Yu. N.

TITLE: New space design solution for local airline airports and air terminals

SOURCE: Ref. zh. Vozdushnyy transport, Abs. 11B153

REF SOURCE: Sb. Str-vo. i arkhitektura. Vyp. 2. Kiyev, Budivel'nyk, 1965, 45-54

TOPIC TAGS: airport, airfield facility

ABSTRACT: Plans are given for local airline airports and air terminals which meet technological and space-planning requirements. The selection of one blueprint or the other should be determined in the first place by its potentiality for the enlarging and reconstruction of the air terminal with minimum replanning and interruption of operation. The blue prints allow for improving the functional structure of airports and air terminals and at the same time the creation of available areas and zones on which, in agreement with technical requirements, can be built additional space of varying capacity and size (in stages as needed) without interfering with the operation of the plant, thus making it possible for the airport or air terminal to handle greater traffic. Tables are given on the basic technical and commercial factors of local airports and air terminals.

The effect of thiourea on development of the thyroid in *Coregonus lavaretus* lada. N. V. Evropetseva. Doklady Akad. Nauk S.S.R. 68, 977-80 (1949).—The infant fish kept 17 days in 0.033% thiourea soln. showed an increased stability to sublethal temp. (6 min. at 29°) and the thyroids showed a higher epithelial layer of the follicles, predominance of oval-shaped nuclei, sharper definition of cell walls and more dense structure of the colloidal matter. In the sturgeon family similar treatment resulted in 33 days in complete elimination of the colloidal matter from the follicles. Thus, functional activity of the gland with respect to displacement of the colloid existed in early postembryonic period, although no thyrotropic activity of the hypophysis could be demonstrated.

AUTHOR: Yevropin, G.P., Moscow

TITLE: The State of Teaching of Physics in RSFSR Schools (O sostoyaniye predavaniya fiziki v shkolakh RSFSR)

PERIODICAL: Fizika v shkole, 1958, Nr 6, pp 43 - 49 (USSR)

ABSTRACT: The degree and type of knowledge acquired by students, as well as their interest for the subject depend to a large degree on the way teaching is organized. The author tells of two model lessons given by S.I. Literat (Prokop'yevsk) and the Honoured Teacher of the RSFSR School P.N. Gatalov (School at Semiluki, Voronezh Oblast'). In Moscow schools, the actual knowledge of students is below the marks given to them. This insufficient knowledge has also been pointed out by the higher educational institutions (the results of entrance examinations in 1957). The Moskovskiy institut tonkoy khimicheskoy tekhnologii (Moscow Institute of Fine Chemical Technology) found that graduates who had only "4" and "5" in their certificates received poor marks in their entrance examinations. Other institutes have had the same experience. Control works conducted by the Main Administration of Schools in 4 cities also showed unsatisfactory re-

Card 1/2

The State of Teaching of Physics in RSFSR Schools SOV-47-58-6-8/28

sults. The principal reason for the poor knowledge of physics of a considerable number of students in the 9th and 10th class is the low standard of the lessons. The author goes into details, mentioning the inadequate equipment and number of laboratories. It is necessary that teachers, school directors and public educational organizations in 1958/59 institute a real improvement in the teaching of physics and in the raising of the students' level of knowledge. The author gives a number of recommendations to attain this end.

Raising in the Bielorussian SSR.

Orig Pub : Uch. zap. Gomel'sk, gos. ped. in-t, 1957, vyp. 5, 138-145

Abstract : It has been established at the Experimental Training Plot  
of the Gomel' Institute and at the Kolkhoz im. Lenin in  
Gomel'skaya Oblast' that the optimal alfalfa sowing time  
is the period from 5 to 20 June. The side-dressing of al-  
falfa with B in a concentration of 0.025% in the period  
of 50% flowering increased the seed output by 37.3% and  
that of green stuff by 75.9%, during which the number of
